Write a uEnvt.txt file to automate TFTP boot.

In this section you learnt how to do the TFTP boot and we are typing **tftpboot** commands each time we want to download the images. So, the challenge for you is to automate TFTP boot by writing uEnv.txt file . That means the boot images have to be downloaded automatically when you reset your board and should boot properly.

Also dont use the S2(boot) button during power up. The moment you press the reset button or give power to the board it should start fetching "dtb" , 'uImage", "initramfs" from TFTP.
