Busybox "Dynamic" Compilation

In the entire "Busybox" lectures we have used "Static" binaries. That means all the generated utilities/commands of busybox are "statically linked" binaries. if you want to test any applications which are cross compiled by "Dynamic linking " then those applications wont execute on your Busybox file system.

The challenge for you is to reconfigure and re-compile the busybox to generate "dynamically linked " binaries/utilities and you should also able to test any applications which are dynamically linked.
